

Bus Stop Rain Water Retention Concept

By collecting the rain water on the bus stops, a municipality will have water for street sweeping, sidewalk pressure washing, cleaning the bus stop itself and cleaning the graffiti near the bus stop. It makes sense to retain this water rather than allowing it to escape into the storm drains. Each bus stop in the city combined could retain 100s of thousands of gallons per year, which could be used to water plants or any other use during the year. We must conserve water and this concept is yet another simple way to do just that.
