

CO2 Atmospheric Collection Device

Since CO₂ clings to nearly everything, it makes sense to collect it. So, I propose using a negatively charged terminal gradient cloud created by vapor and an Extremely Low Frequency Device. Then the cloud will become heavy and fall back to earth or we can fly a large dirigible over it, release hydrogen out the top and suck in the CO₂ as it descends. We then can compress the CO₂ for use to make carbon nano tube sheets for manufacturing or a number of other uses.
