

CO2 Atmospheric Collection Device

Since CO2 clings to nearly everything, it makes sense to collect it. So, I propose using a negatively charged terminal gradient cloud created by vapor and an Extremely Low Frequency Device. Then the cloud will become heavy and fall back to earth or we can fly a large dirigible over it, release hydrogen out the top and suck in the CO2 as it descends. We then can compress the CO2 for use to make carbon nano tube sheets for manufacturing or a number of other uses.
